Relaxing GlasKap® CR Sheets Before Installation

GlasKap CR has highly reflective and emissive properties allowing the cap sheet to stay cooler in the sun. Because of its nature to stay cooler, the sheet requires longer relaxation time prior to application.

JM recommends relaxing cut lengths of GlasKap CR for longer time periods than regular cap sheets to avoid wrinkling during application. The time needed will vary with sunshine and temperature. Additionally, if there is a clean surface area, turn the sheet upside down (black side up) to speed up relaxation.

These recommendations are especially important as we move into fall and winter roofing. Your local JM technical representative can assist you with any questions.
